#### Abstract

In this article, we discuss the solvability of infinite systems of singular integral equations of two variables in the Banach sequence spaces $C\left(I \times I, \ell_{p}\right)$ with $I=[0, T], T>0$ and $1<p<\infty$ with the help of Meir-Keeler condensing operators and Hausdorff measure of noncompactness. With an example, we illustrate our findings.

## 1. Introduction

The theory of infinite systems of differential and/or integral equations plays a pivotal role in nonlinear analysis to encountered the real life problems in different fields e.g., the theory of branching processes, the theory of neural nets, the scaling system theory and the theory of algorithms, etc.

Last few years many authors explored the solvability of infinite systems of equations in Banach spaces, we refer to the readers $[1,2,12-14,17-19,28,30]$ and reference therein.

Kuratowski [20] was first introduced and analysed the concept of measure of noncompactness in the year 1930. For various forms of noncompactness measures, refer [9] for the viewer. The noncompactness measurements are valuable methods commonly that has been used in theory of fixed points, finite difference, computational equations, abstract spaces and optimization, etc. (see [10, 22]). By using the measure of noncompactness, several authors have already solved the numerous infinite systems of equations (see [3, 5-8, 15, 16, 23-27, 29, 31] for example).

Throughout the article we consider $I=[0, T], T>0$. Suppose $E_{1}$ is a real Banach space with the norm $\|$.$\| . Let B\left(x_{0}, d_{1}\right)$ be a closed ball in $E_{1}$ centered at $x_{0}$ and with radius of $d_{1}$. If $X_{1}$ is a nonempty subset of $E_{1}$ then by $\bar{X}_{1}$ and Conv $X_{1}$ we denote the closure and convex closure of $X_{1}$. In addition, let $\mathcal{M}_{E_{1}}$ be the family of all non-empty and bounded subsets of $E_{1}$ and $\mathcal{N}_{E_{1}}$ it consists of all relatively compact sets in its subfamily.

The axiomatic definition of a measure of noncompactness has been formulated by [9].

[^0]Definition 1.1. A function $\mu_{1}: \mathcal{M}_{E_{1}} \rightarrow \mathbb{R}_{+}$is said to be a measure of noncompactness if it satisfies the following assertions:
(i) the family ker $\mu_{1}=\left\{X_{1} \in \mathcal{M}_{E_{1}}: \mu_{1}\left(X_{1}\right)=0\right\}$ is nonempty and ker $\mu_{1} \subset \mathcal{N}_{E_{1}}$.
(ii) $X_{1} \subset Y_{1} \Longrightarrow \mu_{1}\left(X_{1}\right) \leq \mu_{1}\left(Y_{1}\right)$.
(iii) $\mu_{1}\left(\bar{X}_{1}\right)=\mu_{1}\left(X_{1}\right)$.
(iv) $\mu_{1}\left(\operatorname{Conv} X_{1}\right)=\mu_{1}\left(X_{1}\right)$.
(v) $\mu_{1}\left(\lambda X_{1}+(1-\lambda) Y_{1}\right) \leq \lambda \mu_{1}\left(X_{1}\right)+(1-\lambda) \mu_{1}\left(Y_{1}\right)$ for $\lambda \in[0,1]$.
(vi) if $X_{n}^{1} \in \mathcal{M}_{E_{1}}, X_{n}^{1}=\bar{X}_{n}^{1}, X_{n+1}^{1} \subset X_{n}^{1}$ for $n=1,2,3, \ldots$ and $\lim _{n \rightarrow \infty} \mu_{1}\left(X_{n}^{1}\right)=0$, then $\bigcap_{n=1}^{\infty} X_{n}^{1}$ is nonempty.

The family $\operatorname{ker} \mu_{1}$ is called a kernel of measure of noncompactness $\mu_{1}$.
A measure $\mu_{1}$ is said to be sublinear if it satisfies the following assertions:
(1) $\mu_{1}\left(\lambda X_{1}\right)=|\lambda| \mu_{1}\left(X_{1}\right)$ for $\lambda \in \mathbb{R}$.
(2) $\mu_{1}\left(X_{1}+Y_{1}\right) \leq \mu_{1}\left(X_{1}\right)+\mu_{1}\left(Y_{1}\right)$.

A sublinear measure of noncompactness $\mu_{1}$ satisfying the assertion:

$$
\mu_{1}\left(X_{1} \cup Y_{1}\right)=\max \left\{\mu_{1}\left(X_{1}\right), \mu_{1}\left(Y_{1}\right)\right\}
$$

and such that $\operatorname{ker} \mu_{1}=\mathcal{N}_{E_{1}}$ is said to be regular.
For a nonempty and bounded subset $S$ of a metric space $X_{1}$, the Kuratowski measure of noncompactness is defined as

$$
\alpha(S)=\inf \left\{\delta>0: S \subset \bigcup_{i=1}^{n} S_{i}, \operatorname{diam}\left(S_{i}\right) \leq \delta \text { for } 1 \leq i \leq n, n \in \mathbb{N}\right\}
$$

where $\operatorname{diam}\left(S_{i}\right)$ denotes the diameter of the set $S_{i}$, i.e.,

$$
\operatorname{diam}\left(S_{i}\right)=\sup \left\{d(x, y): x, y \in S_{i}\right\}
$$

The Hausdorff measure of noncompactness for a bounded set $S$ is defined by

$$
\mathfrak{C}(S)=\inf \left\{\epsilon>0: S \text { has finite } \epsilon \text {-net in } X_{1}\right\}
$$

We again recall the basic properties of the Hausdorff measure od noncompactness.
Let $F, F_{1}$ and $F_{2}$ be bounded subsets of the metric space $\left(X_{1}, d\right)$. Then
(i) $\mathfrak{C}(F)=0$ if and only if $F$ is totally bounded;
(ii) $\mathfrak{C}(F)=\mathscr{C}(\bar{F})$, where $\bar{F}$ denotes the closure of $F$;
(iii) $F_{1} \subset F_{2}$ implies that $\mathfrak{C}\left(F_{1}\right) \leq \mathfrak{C}\left(F_{2}\right)$;
(iv) $\mathfrak{C}\left(F_{1} \cup F_{2}\right)=\max \left\{\mathscr{C}\left(F_{1}\right), \mathscr{C}\left(F_{2}\right)\right\}$;
(v) $\mathfrak{C}\left(F_{1} \cap F_{2}\right) \leq \min \left\{\mathscr{C}\left(F_{1}\right), \mathfrak{C}\left(F_{2}\right)\right\}$.

In case of a Banach space $\left(X_{1},\|\cdot\|\right)$, the function $\mathfrak{C}$ has some additional properties connected with the linear structure. For example we have
(i) $\mathfrak{C}\left(F_{1}+F_{2}\right) \leq \mathfrak{C}\left(F_{1}\right)+\mathfrak{C}\left(F_{2}\right)$,
(ii) $\mathfrak{C}(F+x)=\mathfrak{C}(F)$ for all $x \in X_{1}$,
(iii) $\mathfrak{C}(\alpha F)=|\alpha| \mathscr{C}(F)$ for all $\alpha \in \mathbb{R}$.

Definition 1.2. [4] Let $G_{1}$ and $G_{2}$ be two Banach spaces and let $\mu_{1}$ and $\mu_{2}$ be arbitrary measure of noncompactness on $G_{1}$ and $G_{2}$, respectively. An operator from $G_{1}$ to $G_{2}$ is called a $\left(\mu_{1}, \mu_{2}\right)$-condensing operator if it is continuous and $\mu_{2}(f(D))<\mu_{1}(D)$ for every set $D \subset G_{1}$ with compact closure.

Remark 1.3. If $G_{1}=G_{2}$ and $\mu_{1}=\mu_{2}=\mu$, then $f$ is called a $\mu$-condensing operator.
If we consider taking the diameter of a set and the indicator function of a family of non-relatively compact sets (see [4]) as a measure of noncompactness, the contractive maps and the compact maps condense. In 1969, the preceding very fascinating fixed point theorem was proven by Meir and Keeler [21], which would be a generalized form of the notion of Banach contraction.
Definition 1.4. [21] Let $(X, d)$ be a metric space. Then a mapping $O$ on $X$ is said to be a Meir-Keeler contraction if for any $\epsilon>0$, there exists $\delta>0$ such that

$$
\epsilon \leq d(x, y)<\epsilon+\delta \Longrightarrow d(O x, O y)<\epsilon, \forall x, y \in X
$$

Theorem 1.5. [21] Let $(X, d)$ be a complete metric space. If $O: X \rightarrow X$ is a Meir-Keeler contraction, then $O$ has a unique fixed point.

The preceding results are reported in [3], which are helpful in our assessment.
Definition 1.6. [3] Let $C$ be a nonempty subset of a Banach space $E$ and let $\mu$ be an arbitrary measure of noncompactness on $E$. We say that an operator $\mathcal{O}: C \rightarrow C$ is a Meir-Keeler condensing operator if for any $\epsilon>0$, there exists $\delta>0$ such that

$$
\epsilon \leq \mu(X)<\epsilon+\delta \Longrightarrow \mu(O(X))<\epsilon
$$

for any bounded subset $X$ of $C$.
Theorem 1.7. [3] Let C be a nonempty, bounded, closed and convex subset of a Banach space E and let $\mu$ be an arbitrary measure of noncompactness on E. If $O: C \rightarrow C$ is a continuous and Meir-Keeler condensing operator, then $O$ has at least one fixed point and the set of all fixed points of $O$ in $C$ is compact.

## 2. Hausdorff measure of noncompactness in sequence spaces

In the Banach space $\left(\ell_{p},\|.\|_{\ell_{p}}\right)$, the Hausdorff measure of noncompactness $\mathfrak{C}$ is defined as follows (see [9]):

$$
\begin{equation*}
\mathfrak{c}_{\ell_{p}}(D)=\lim _{n \rightarrow \infty}\left[\sup _{u \in D}\left(\sum_{k=n}^{\infty}\left|u_{k}\right|^{p^{\frac{1}{p}}}\right)^{\frac{1}{p}}\right] \tag{1}
\end{equation*}
$$

where $u=\left(u_{i}\right)_{i=1}^{\infty} \in \ell_{p}$ and $D \in \mathcal{M}_{\ell_{p}}$.
Let us define $C\left(I \times I, \ell_{p}\right)$ denotes the space of all continuous functions defined on $I \times I$ with values in $\ell_{p}$. Then $C\left(I \times I, \ell_{p}\right)$ is also a Banach space with the norm $\|x(\varkappa, \wp)\|_{C\left(I \times I, \ell_{p}\right)}=\sup \left\{\|x(\varkappa, \wp)\|_{\ell_{p}}: \varkappa, \wp \in I\right\}$, where $x(\varkappa, \wp) \in C\left(I \times I, \ell_{p}\right)$. For any non-empty bounded subset $\hat{E}$ of $C\left(I \times I, \ell_{p}\right)$ and $\varkappa, \wp \in I$, let $\hat{E}(\varkappa, \wp)=$ $\{x(\varkappa, \wp): \varkappa, \wp \in I\}$.

Now, using (1), we conclude that the Housdorff measure of noncompactness for $\hat{E} \subset C\left(I \times I, \ell_{p}\right)$ can be defined by

$$
\mathfrak{C}_{C\left(I \times I, \ell_{p}\right)}(\hat{E})=\sup \left\{\mathfrak{C}_{\ell_{p}}(\hat{E}(\varkappa, \wp)): \varkappa, \wp \in I\right\} .
$$

In this article, the existence of solution of the following infinite systems of singular integral equations of two variables is discussed

$$
\begin{equation*}
x_{i}(\varkappa, \wp)=h_{i}(\varkappa, \wp, x(\varkappa, \wp))+f_{i}\left(\varkappa, \wp, x(\varkappa, \wp), \int_{0}^{s} \int_{0}^{t} \frac{u_{i}(\varkappa, \wp, v, w, x(v, w))}{(\varkappa-v)^{\alpha}(\wp-w)^{\beta}} d v d w\right), \tag{2}
\end{equation*}
$$

where $x(\varkappa, \wp)=\left(x_{i}(\varkappa, \wp)\right)_{i=1}^{\infty} \in E,(\varkappa, \wp) \in I \times I$ and $x_{i}(\varkappa, \wp) \in C(I \times I, \mathbb{R})$ for all $i \in \mathbb{N}$ and $\alpha, \beta \in(0,1) . C(I \times I, \mathbb{R})$ denotes the Banach space of all real continuous functions on $I \times I$ with norm $\|x\|=\sup \{|x(\varkappa, \wp)|: \varkappa, \wp \in I\}$ and $E$ is a Banach sequence space $(E,\|\cdot\|)$.

## 3. Solvability of infinite systems of singular integral equations of two variables in $C\left(I \times I, \ell_{p}\right)$ with $1<p<\infty$

Assume that
(i) $f_{i}: I \times I \times C\left(I \times I, \ell_{p}\right) \times \mathbb{R} \rightarrow \mathbb{R}(i \in \mathbb{N})$ are continuous with

$$
\sum_{i \geq 1}\left|f_{i}\left(\varkappa, \wp, x^{0}(\varkappa, \wp), 0\right)\right|^{p}
$$

converges to zero for all $\varkappa, \wp \in I$, where $x^{0}(\varkappa, \wp)=\left(x_{i}^{0}(\varkappa, \wp)\right)_{i=1}^{\infty}$ and $x_{i}^{0}(\varkappa, \wp)=0$ for all $i \in \mathbb{N},(\varkappa, \wp) \in$ $I \times I$. Also there exist $\hat{b}_{i}, \hat{\psi}_{i}: I \times I \rightarrow \mathbb{R}_{+}(i \in \mathbb{N})$ which are bounded functions on $I \times I$ such that

$$
\begin{aligned}
& \left|f_{i}\left(\varkappa, \wp, x^{1}(\varkappa, \wp), l_{1}(\varkappa, \wp)\right)-f_{i}\left(\varkappa, \wp, x^{2}(\varkappa, \wp), l_{2}(\varkappa, \wp)\right)\right|^{p} \\
& \leq \hat{b}_{i}(\varkappa, \wp)\left|x_{i}^{1}(\varkappa, \wp)-x_{i}^{2}(\varkappa, \wp)\right|^{p}+\hat{\psi}_{i}(\varkappa, \wp)\left|l_{1}(\varkappa, \wp)-l_{2}(\varkappa, \wp)\right|^{p},
\end{aligned}
$$

where $x^{1}(\varkappa, \wp)=\left(x_{i}^{1}(\varkappa, \wp)\right)_{i=1}^{\infty}, x^{2}(\varkappa, \wp)=\left(x_{i}^{2}(\varkappa, \wp)\right)_{i=1}^{\infty} \in C\left(I \times I, \ell_{p}\right) ; x_{i}^{1}(\varkappa, \wp), x_{i}^{2}(\varkappa, \wp) \in C(I \times I, \mathbb{R})$ for all $i \in \mathbb{N}$ and $l_{1}, l_{2}: I \times I \rightarrow \mathbb{R}$ are bounded.
(ii) $u_{i}: I \times I \times I \times I \times C\left(I \times I, \ell_{p}\right) \rightarrow \mathbb{R}(i \in \mathbb{N})$ are continuous. Moreover

$$
\hat{r}_{i}=\sup \left\{\sum_{k \geq i}\left|\int_{0}^{s} \int_{0}^{t} \frac{u_{k}(\varkappa, \wp, v, w, x(v, w))}{(\varkappa-v)^{\alpha}(\wp-w)^{\beta}} d v d w\right|^{p}: \varkappa, \wp, v, w \in I, x(v, w) \in C\left(I \times I, \ell_{p}\right)\right\}<\infty
$$

Also $\sup _{i} \hat{r}_{i}=\hat{R}$ and $\lim _{i \rightarrow \infty} \hat{r}_{i}=0$.
(iii) $h_{i}: I \times I \times C\left(I \times I, \ell_{p}\right) \rightarrow \mathbb{R}(i \in \mathbb{N})$ are continuous and there exist constants $\hat{D}_{i} \geq 0(i \in \mathbb{N})$ such that

$$
\left|h_{i}(\varkappa, \wp, x(\varkappa, \wp))-h_{i}(\varkappa, \wp, y(\varkappa, \wp))\right|^{p} \leq \hat{D}_{i}\left|x_{i}(\varkappa, \wp)-y_{i}(\varkappa, \wp)\right|^{p}, \forall i \in \mathbb{N},
$$

where $y(\varkappa, \wp)=\left(y_{i}(\varkappa, \wp)\right)_{i=1}^{\infty} \in C\left(I \times I, \ell_{p}\right)$ and $y_{i}(\varkappa, \wp) \in C(I \times I, \mathbb{R})$ for all $i \in \mathbb{N}$ and

$$
\sum_{i \geq 1}\left|h_{i}\left(\varkappa, \wp, x^{0}(\varkappa, \wp)\right)\right|^{p}
$$

converges to zero and $\sup \hat{D}_{i}=\hat{D}$.
(iv) Define an operator $\bar{Q}$ on $I \times I \times C\left(I \times I, \ell_{p}\right)$ to $C\left(I \times I, \ell_{p}\right)$ as follows

$$
(\varkappa, \wp, x(\varkappa, \wp)) \rightarrow(\bar{Q} x)(\varkappa, \wp),
$$

where

$$
\begin{aligned}
& (\bar{Q} x)(\varkappa, \wp)=\left(\left(\bar{Q}_{1} x\right)(\varkappa, \wp),\left(\bar{Q}_{2} x\right)(\varkappa, \wp),\left(\bar{Q}_{3} x\right)(\varkappa, \wp), \ldots\right), \\
& \left(\bar{Q}_{i} x\right)(\varkappa, \wp)=h_{i}(\varkappa, \wp, x(\varkappa, \wp))+f_{i}\left(\varkappa, \wp, x(\varkappa, \wp), q_{i}(x)\right)
\end{aligned}
$$

and

$$
q_{i}(x)=\int_{0}^{s} \int_{0}^{t} \frac{u_{i}(\varkappa, \wp, v, w, x(v, w))}{(\varkappa-v)^{\alpha}(\wp-w)^{\beta}} d v d w, i \in \mathbb{N}
$$

(v) Let

$$
\sup \left\{\hat{b}_{i}(\varkappa, \wp): \varkappa, \wp \in I, i \in \mathbb{N}\right\}=\hat{B}<\infty .
$$

(vi) Let $\bar{\psi}=\sup \left\{\hat{\psi}_{i}(\varkappa, \wp): \varkappa, \wp \in I, i \in \mathbb{N}\right\}$ and $\gamma: I \times I \rightarrow \mathbb{R}_{+}$defined by

$$
\gamma(\varkappa, \wp)=\left(\varkappa^{1-\alpha} \wp^{1-\beta}\right)^{p} \sup _{i} \hat{\psi}_{i}(\varkappa, \wp) .
$$

Also let $\hat{\gamma}=\sup \{\gamma(\varkappa, \wp): \varkappa, \wp \in I\}<\infty$.
(vii) We also assume that $0<\hat{B}+\hat{D}<4^{1-p}$.

Theorem 3.1. Under the hypothesis (i)-(vii), the infinite systems (2) has at least one solution $x(\chi, \wp)=\left(x_{i}(\chi, \wp)\right)_{i=1}^{\infty} \in$ $C\left(I \times I, \ell_{p}\right)$ for all $t, s \in I$ and $x_{i}(\varkappa, \wp) \in C(I \times I, \mathbb{R})$ for all $i \in \mathbb{N}$.
Proof. By using (2) and (i)-(vii), for all arbitrarily fixed $t, s \in I$, we have

$$
\begin{aligned}
& \|x(\varkappa, \wp)\|_{\ell_{p}}^{p} \\
& =\left.\left.\sum_{i \geq 1}\right|_{h_{i}(\varkappa, \wp, x(\varkappa, \wp))+f_{i}}\left(\varkappa, \wp, x(\varkappa, \wp), \int_{0}^{s} \int_{0}^{t} \frac{u_{i}(\varkappa, \wp, v, w, x(v, w))}{(\varkappa-v)^{\alpha}(\wp-w)^{\beta}} d v d w\right)\right|^{p} \\
& \leq 4^{p-1} \sum_{i \geq 1}\left|h_{i}(\varkappa, \wp, x(\varkappa, \wp))-h_{i}\left(\varkappa, \wp, x^{0}(\varkappa, \wp)\right)\right|^{p}+4^{p-1} \sum_{i \geq 1}\left|h_{i}\left(\varkappa, \wp, x^{0}(\varkappa, \wp)\right)\right|^{p} \\
& +4^{p-1} \sum_{i \geq 1}\left|f_{i}\left(\varkappa, \wp, x(\varkappa, \wp), \int_{0}^{s} \int_{0}^{t} \frac{u_{i}(\varkappa, \wp, v, w, x(v, w))}{(\varkappa-v)^{\alpha}(\wp-w)^{\beta}} d v d w\right)-f_{i}\left(\varkappa, \wp, x^{0}(\varkappa, \wp), 0\right)\right|^{p} \\
& +4^{p-1} \sum_{i \geq 1}\left|f_{i}\left(\varkappa, \wp, x^{0}(\varkappa, \wp),,\right)\right|^{p} \\
& \leq 4^{p-1} \sum_{i \geq 1}\left\{\hat{D}_{i}\left|x_{i}(\varkappa, \wp)\right|^{p}\right\}+4^{p-1} \sum_{i \geq 1}\left\{\hat{b}_{i}(\varkappa, \wp)\left|x_{i}(\varkappa, \wp)\right|^{p}+\hat{\psi}_{i}(\varkappa, \wp)\left|\int_{0}^{s} \int_{0}^{t} \frac{u_{i}(\varkappa, \wp, v, w, x(v, w))}{(\varkappa-v)^{\alpha}(\wp-w)^{\beta}} d v d w\right|^{p}\right\} \\
& \leq 4^{p-1}(\hat{B}+\hat{D}) \sum_{i \geq 1}\left|x_{i}(\varkappa, \wp)\right|^{p}+4^{p-1} \sup _{j} \hat{\psi}_{i}(\varkappa, \wp) \sum_{i \geq 1}\left|\int_{0}^{s} \int_{0}^{t} \frac{u_{i}(\varkappa, \wp, v, w, x(v, w))}{(\varkappa-v)^{\alpha}(\wp-w)^{\beta}} d v d w\right|^{p} \\
& \leq 4^{p-1}(\hat{B}+\hat{D})\|x(\varkappa, \wp)\|_{\ell_{p}}^{p}+4^{p-1} \bar{\psi} \hat{R} .
\end{aligned}
$$

i.e., $\left\{1-4^{p-1}(\hat{B}+\hat{D})\right\}\|x(\varkappa, \wp)\|_{\ell_{p}}^{p} \leq 4^{p-1} \bar{\psi} \hat{R}$ gives $\|x(\chi, \wp)\|_{\ell_{p}}^{p} \leq \frac{4^{p-1} \overline{\mathcal{Y}}}{1-4^{p-1}} \hat{(\hat{B}+\hat{D})}=\bar{r}^{p}$ (say).

Thus $\|x(\varkappa, \wp)\|_{\ell_{p}} \leq \bar{r}$ and hence $\|x(\varkappa, \wp)\|_{C\left(I X I, \ell_{p}\right)} \leq \bar{r}$.
Therefore $x(\varkappa, \wp) \in C\left(I \times I, \ell_{p}\right)$.
Assume $D=B\left(x^{0}(\varkappa, \wp), \bar{r}\right)$ be the closed ball with center at $x^{0}(\varkappa, \wp)$ and radius $\bar{r}$, thus $D$ is an non-empty, bounded, closed and convex subset of $C\left(I \times I, \ell_{p}\right)$. Let us define $\bar{Q}=\left(\bar{Q}_{i}\right)$ be an operator defined as follows. For all arbitrary fixed $\varkappa, \wp \in I$,

$$
(\bar{Q} x)(\varkappa, \wp)=\left\{\left(\bar{Q}_{i} z\right)(\varkappa, \wp)\right\}=\left\{h_{i}(\varkappa, \wp, x(\varkappa, \wp))+f_{i}\left(\varkappa, \wp, x(\varkappa, \wp), q_{i}(x(\varkappa, \wp))\right)\right\},
$$

where $x(\varkappa, \wp)=\left(x_{i}(\varkappa, \wp)\right)_{i=1}^{\infty} \in D$ and $x_{i}(\varkappa, \wp) \in C(I \times I, \mathbb{R})$ for all $i \in \mathbb{N}$.
Since for each $(\varkappa, \wp) \in I \times I$, we have

$$
\sum_{i \geq 1}\left|\left(\bar{Q}_{i} x\right)(\varkappa, \wp)\right|^{p}=\sum_{i \geq 1}\left|h_{i}(\varkappa, \wp, x(\varkappa, \wp))+f_{i}\left(\varkappa, \wp, x(\varkappa, \wp), q_{i}(x(\varkappa, \wp))\right)\right|^{p}<\infty .
$$

Hence $(\bar{Q} x)(\varkappa, \wp) \in C\left(I \times I, \ell_{p}\right)$.
Since $\left\|(\bar{Q} x)(\varkappa, \wp)-x^{0}(\varkappa, \wp)\right\|_{C\left(I x I, \ell_{p}\right)} \leq \bar{r}$ therefore $\bar{Q}$ is self mapping on $D$.

We have to show that $\bar{Q}$ is continuous on $D$.
Let $\epsilon>0$ and arbitrary $x(\varkappa, \wp)=\left(x_{j}(\chi, \wp)\right)_{j=1}^{\infty}, y(\varkappa, \wp)=\left(y_{j}(\chi, \wp)\right)_{j=1}^{\infty} \in D$ such that $\|x(\varkappa, \wp)-y(\varkappa, \wp)\|_{C\left(I \times I, \ell_{p}\right)}^{p}<\frac{\epsilon^{p}}{2^{p}(\hat{B}+\hat{D})}$.
For arbitrarily fixed $\varkappa, \wp \in I$ and $i \in \mathbb{N}$, we have

$$
\begin{aligned}
& \left|\left(\bar{Q}_{i} x\right)(\varkappa, \wp)-\left(\bar{Q}_{i} y\right)(\varkappa, \wp)\right|^{p} \\
& =\left|h_{i}(\varkappa, \wp, x(\varkappa, \wp))+f_{i}\left(\varkappa, \wp, x(\varkappa, \wp), q_{i}(x(\varkappa, \wp))\right)-h_{i}(\varkappa, \wp, y(\varkappa, \wp))-f_{i}\left(\varkappa, \wp, y(\varkappa, \wp), q_{i}(y(\varkappa, \wp))\right)\right|^{p} \\
& \leq 2^{p-1}\left|h_{i}(\varkappa, \wp, x(\varkappa, \wp))-h_{i}(\varkappa, \wp, y(\varkappa, \wp))\right|^{p}+2^{p-1}\left|f_{i}\left(\varkappa, \wp, x(\varkappa, \wp), q_{i}(x(\varkappa, \wp))\right)-f_{i}\left(\varkappa, \wp, y(\varkappa, \wp), q_{i}(y(\varkappa, \wp))\right)\right|^{p} \\
& \leq 2^{p-1}\left\{\hat{D}_{i}\left|x_{i}(\varkappa, \wp)-y_{i}(\varkappa, \wp)\right|^{p}+\hat{b}_{i}(\varkappa, \wp)\left|x_{i}(\varkappa, \wp)-y_{i}(\varkappa, \wp)\right|^{p}+\hat{\psi}_{i}(\varkappa, \wp)\left|q_{i}(x(\varkappa, \wp))-q_{i}(y(\varkappa, \wp))\right|^{p}\right\} \\
& \leq 2^{p-1}(\hat{B}+\hat{D})\left|x_{i}(\varkappa, \wp)-y_{i}(\varkappa, \wp)\right|^{p} \\
& +2^{p-1} \hat{\psi}_{i}(\varkappa, \wp)\left\{\int_{0}^{s} \int_{0}^{t} \frac{\left|u_{i}(\varkappa, \wp, v, w, x(v, w))-u_{i}(\varkappa, \wp, v, w, y(v, w))\right|}{(\varkappa-v)^{\alpha}(\wp-w)^{\beta}} d v d w\right\}^{p} .
\end{aligned}
$$

Let

$$
U=\sup \left\{\left|u_{i}(\varkappa, \wp, v, w, x(v, w))-u_{i}(\varkappa, \wp, v, w, y(v, w))\right|: \varkappa, \wp, v, w \in I ; x(v, w), y(v, w) \in D, i \in \mathbb{N}\right\}
$$

As $\epsilon \rightarrow 0$ we have $U \rightarrow 0$ because of assumption (ii) thus we can choose $\frac{2^{p-1} U \hat{\gamma}}{(1-\alpha)^{p}(1-\beta)^{p}}<\frac{\epsilon^{p}}{2^{i+1}}$.
Therefore, we have

$$
\begin{aligned}
& \left|\left(\bar{Q}_{i} x\right)(\varkappa, \wp)-\left(\bar{Q}_{i} y\right)(\varkappa, \wp)\right|^{p} \\
& <2^{p-1}(\hat{B}+\hat{D})\left|x_{i}(\varkappa, \wp)-y_{i}(\varkappa, \wp)\right|^{p}+2^{p-1} U^{p} \sup _{i} \hat{\psi}_{i}(\varkappa, \wp)\left\{\int_{0}^{s} \int_{0}^{t} \frac{1}{(\varkappa-v)^{\alpha}(\wp-w)^{\beta}} d v d w\right\}^{p} \\
& =2^{p-1}(\hat{B}+\hat{D})\left|x_{i}(\varkappa, \wp)-y_{i}(\varkappa, \wp)\right|^{p}+2^{p-1} U^{p} \sup _{i} \hat{\psi}_{i}(\varkappa, \wp)\left\{\frac{\varkappa^{1-\alpha} \wp_{1}^{1-\beta}}{(1-\alpha)(1-\beta)}\right\}^{p} \\
& \leq 2^{p-1}(\hat{B}+\hat{D})\left|x_{i}(\varkappa, \wp)-y_{i}(\varkappa, \wp)\right|^{p}+\frac{2^{p-1} U^{p} \hat{\gamma}}{(1-\alpha)^{p}(1-\beta)^{p}} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \sum_{i \geq 1}\left|\left(\bar{Q}_{i} x\right)(\varkappa, \wp)-\left(\bar{Q}_{i} y\right)(\varkappa, \wp)\right|^{p} \\
& <2^{p-1}(\hat{B}+\hat{D})\|x(\varkappa, \wp)-y(\varkappa, \wp)\|_{C\left(I \times I, \ell_{p}\right)}^{p}+\sum_{i \geq 1} \frac{\epsilon^{p}}{2^{i+1}}<\epsilon^{p} .
\end{aligned}
$$

Thus $\|(\bar{Q} x)(\varkappa, \wp)-(\bar{Q} y)(\varkappa, \wp)\|_{C\left(I \times I, \ell_{p}\right)}<\epsilon$. Therefore $\bar{Q}$ is continuous on $D$.

We have for arbitrary fixed $\varkappa, \wp \in I$,

$$
\begin{aligned}
& \mathfrak{C}_{\ell_{p}}(\hat{Q}(D)) \\
& =\lim _{n \rightarrow \infty}\left[\sup _{x(\varkappa, \wp) \in D}\left\{\sum_{i \geq n}\left|h_{i}(\varkappa, \wp, x(\varkappa, \wp))+f_{i}\left(\varkappa, \wp, x(\varkappa, \wp), q_{i}(x(\varkappa, \wp))\right)\right|^{p}\right\}\right]^{\frac{1}{p}} \\
& \leq \lim _{n \rightarrow \infty} \sup _{x(\varkappa, \beta) \in D}\left[4^{p-1}(\hat{B}+\hat{D}) \sum_{i \geq n}\left|x_{i}(\varkappa, \wp)\right|^{p}+4^{p-1} \sup _{i} \hat{\psi}_{i}(\varkappa, \wp) \sum_{i \geq n}\left|\int_{0}^{s} \int_{0}^{t} \frac{u_{i}(\varkappa, \wp, v, w, x(v, w))}{(\varkappa-v)^{\alpha}(\wp-w)^{\beta}} d v d w\right|^{p}\right]^{\frac{1}{p}} \\
& \leq \lim _{n \rightarrow \infty} \sup _{x(\varkappa, \beta) \in D}\left[4^{p-1}(\hat{B}+\hat{D}) \sum_{i \geq n}\left|x_{i}(\varkappa, \wp)\right|^{p}+4^{p-1} \hat{r}_{n} \sup _{i} \hat{\psi}_{i}(\varkappa, \wp)\right]^{\frac{1}{p}}
\end{aligned}
$$

i.e.,

$$
\mathfrak{C}_{\ell_{p}}(\hat{Q}(D)) \leq 4^{1-\frac{1}{p}}(\hat{B}+\hat{D})^{\frac{1}{p}} \mathfrak{C}_{\ell_{p}}(D)
$$

gives

$$
\mathfrak{C}_{C\left(I \times I, \ell_{p}\right)}(\hat{Q}(D)) \leq 4^{1-\frac{1}{p}}(\hat{B}+\hat{D})^{\frac{1}{p}} \mathfrak{C}_{C\left(I \times I, e_{p}\right)}(D)
$$

We observe that $\mathfrak{C}_{C\left(I \times I, \ell_{p}\right)}(\bar{Q}(D)) \leq 4^{1-\frac{1}{p}}(\hat{B}+\hat{D})^{\frac{1}{p}} \mathfrak{C}_{C\left(I \times I, \ell_{p}\right)}(D)<\epsilon \Rightarrow \mathfrak{C}_{C\left(I \times I, \ell_{p}\right)}(D)<\frac{\epsilon}{4^{1-\frac{1}{p}}(\hat{B}+\hat{D})^{\frac{1}{p}}}$.
Taking $\delta=\frac{\epsilon\left(1-4^{1-\frac{1}{p}}(\hat{B}+\hat{D})^{\frac{1}{p}}\right)}{4^{1-\frac{1}{p}}(\hat{B}+\hat{D})^{\frac{1}{p}}}$, we get $\epsilon \leq \widehat{C}_{C\left(I \times I, \ell_{p}\right)}(D)<\epsilon+\delta$. Therefore $\bar{Q}$ is a Meir-Keeler condensing operator defined on the set $D \subset C\left(I \times I, \ell_{p}\right)$. So $\bar{Q}$ satisfies all the assertions of Theorem 1.7 which implies $\bar{Q}$ has a fixed point in $D$. Hence the systems (2) has a solution in $C\left(I \times I, \ell_{p}\right)$.

## 4. Example

Consider the following infinite systems of singular integral equations

$$
\begin{equation*}
x_{i}(\varkappa, \wp)=\frac{1}{8+\varkappa^{2} \wp^{2}} \sum_{j=i}^{i+1}\left(\frac{x_{j}(\varkappa, \wp)}{j^{2}}\right)+\sum_{j=i}^{i+1}\left(\frac{\left|x_{j}(\varkappa, \wp)\right|}{4^{2} j^{2}}\right)+\frac{1}{e^{\varkappa}} \int_{0}^{s} \int_{0}^{t} \frac{\sin ^{2}\left(1+\sum_{j=1}^{2 i} x_{j}(v, w)\right)}{\left(\varkappa \wp+i^{2}\right)(\varkappa-v)^{\frac{1}{2}}(\wp-w)^{\frac{1}{2}}} d v d w \tag{3}
\end{equation*}
$$

where $i \in \mathbb{N}$ and $\chi, \wp \in I=[0,1]$. Here

$$
\begin{aligned}
& h_{i}(\varkappa, \wp, x(\varkappa, \wp))=\frac{1}{8+\varkappa^{2} \wp^{2}} \sum_{j=i}^{i+1}\left(\frac{x_{j}(\varkappa, \wp)}{j^{2}}\right), \\
& f_{i}\left(\varkappa, \wp, x(\varkappa, \wp), q_{i}(x(\varkappa, \wp))\right)=\sum_{j=i}^{i+1}\left(\frac{\left|x_{j}(\varkappa, \wp)\right|}{4^{2} j^{2}}\right)+\frac{1}{e^{\chi \wp}} q_{i}(x(\varkappa, \wp)), \\
& q_{i}(x(\varkappa, \wp))=\int_{0}^{s} \int_{0}^{t} \frac{\sin ^{2}\left(1+\sum_{j=1}^{2 i} x_{j}(v, w)\right)}{\left(\varkappa \wp+i^{2}\right)(\varkappa-v)^{\frac{1}{2}}(\wp-w)^{\frac{1}{2}}} d v d w \\
& u_{i}(\varkappa, \wp, v, w, x(v, w))=\sin ^{2}\left(1+\sum_{j=1}^{2 i} x_{j}(v, w)\right)
\end{aligned}
$$

and $\alpha=\beta=\frac{1}{2}$.
Now if $x(\varkappa, \wp)=\left(x_{i}(\varkappa, \wp)\right), y(\varkappa, \wp)=\left(y_{i}(\varkappa, \wp)\right) \in C\left(I \times I, \ell_{p}\right)$ then $\left(f_{i}\left(\varkappa, \wp, x(\varkappa, \wp), q_{i}(x(\varkappa, \wp))\right)\right) \in C\left(I \times I, \ell_{p}\right)$ and $\left(h_{i}(\varkappa, \wp, x(\varkappa, \wp))\right) \in C\left(I \times I, \ell_{p}\right)$, since for arbitrary fixed $\varkappa, \wp \in I$,

$$
\begin{aligned}
& \sum_{i \geq 1}\left|h_{i}(\varkappa, \wp, x(\varkappa, \wp))\right|^{p} \\
& \leq \sum_{i \geq 1}\left|\frac{1}{8+\varkappa^{2} \wp^{2}} \sum_{j=i}^{i+1}\left(\frac{x_{j}(\varkappa, \wp)}{j^{2}}\right)\right|^{p} \\
& =\frac{1}{\left(8+\varkappa^{2} \wp^{2}\right)^{p}} \sum_{i \geq 1}\left|\sum_{j=i}^{i+1}\left(\frac{x_{j}(\varkappa, \wp)}{j^{2}}\right)\right|^{p} \\
& \leq \frac{1}{8^{p}} \sum_{i \geq 1}\left\{2^{p-1} \sum_{j=i}^{i+1} \frac{\left|x_{j}(\varkappa, \wp)\right|^{p}}{j^{2 p}}\right\} \\
& \leq \frac{2^{p-1}}{8^{p}} \sum_{i \geq 1}\left\{\sum_{j=i}^{i+1}\left|x_{j}(\varkappa, \wp)\right|^{p}\right\} \\
& \leq \frac{1}{4^{p}}\|x(\varkappa, \wp)\|_{C\left(I \times I, \ell_{p}\right)}^{p}<\infty
\end{aligned}
$$

and

$$
\begin{aligned}
& \sum_{i \geq 1}\left|f_{i}\left(\varkappa, \wp, x(\varkappa, \wp), q_{i}(x(\varkappa, \wp))\right)\right|^{p} \\
& =\left.\sum_{i \geq 1}\right|_{j=i} ^{i+1}\left(\frac{\left|x_{j}(\varkappa, \wp)\right|}{4^{2} j^{2}}\right)+\left.\frac{1}{e^{\varkappa \wp}} q_{i}(x(\varkappa, \wp))\right|^{p} \\
& \leq 2^{p-1} \sum_{i \geq 1}\left\{\left|\sum_{j=i}^{i+1}\left(\frac{\left|x_{j}(\varkappa, \wp)\right|}{4^{2} j^{2}}\right)\right|^{p}+\left|\frac{1}{e^{\chi \varkappa}} q_{i}(x(\varkappa, \wp))\right|^{p}\right\} \\
& \leq 2^{p-1} \sum_{i \geq 1}\left\{2^{p-1} \sum_{j=i}^{i+1}\left(\frac{\left|x_{j}(\varkappa, \wp)\right|^{p}}{4^{2 p} j^{2 p}}\right)+\left|\frac{1}{e^{\varkappa \wp}} q_{i}(x(\varkappa, \wp))\right|^{p}\right\} \\
& \leq 2^{p-1} \sum_{i \geq 1}\left\{\frac{2^{p}}{4^{2 p}}\left|x_{i}(\varkappa, \wp)\right|^{p}+\frac{\left|q_{i}(x(\varkappa, \wp))\right|^{p}}{e^{p \varkappa \wp}}\right\} \\
& =\frac{1}{2.4^{p}}\|x(\varkappa, \wp)\|_{\ell_{p}}^{p}+\frac{2^{p-1}}{e^{p \varkappa \wp}} \sum_{i \geq 1}\left|q_{i}(x(\varkappa, \wp))\right|^{p} .
\end{aligned}
$$

Let $\sum_{i \geq 1} \frac{1}{i^{2 p}}=B$. Since $p>1$, we have $B<\infty$.
Again

$$
\begin{aligned}
& \left|q_{i}(x(\varkappa, \wp))\right| \\
& \leq \frac{1}{i^{2}} \int_{0}^{s} \int_{0}^{t} \frac{1}{(\varkappa-v)^{\frac{1}{2}}(\wp-w)^{\frac{1}{2}}} d v d w \\
& =\frac{4 \sqrt{\varkappa \wp}}{i^{2}} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \sum_{i \geq 1}\left|f_{i}\left(\varkappa, \wp, x(\varkappa, \wp), q_{i}(x(\varkappa, \wp))\right)\right|^{p} \\
& \leq \frac{1}{2.4^{p}}\|x(\varkappa, \wp)\|_{\ell_{p}}^{p}+\frac{2^{p-1}}{e^{p \varkappa \wp}} \sum_{i \geq 1}\left(\frac{4 \sqrt{\varkappa \wp}}{i^{2}}\right)^{p} \\
& =\frac{1}{2.4^{p}}\|x(\varkappa, \wp)\|_{\ell_{p}}^{p}+\frac{2^{p-1} 4^{p}(\sqrt{\varkappa \wp})^{p}}{e^{p \varkappa \wp}} \sum_{i \geq 1} \frac{1}{i^{2 p}} \\
& \leq \frac{1}{2.4^{p}}\|x(\varkappa, \wp)\|_{C\left(I \times I, \ell_{p}\right)}^{p}+\frac{2^{3 p-1} B}{(\sqrt{2 e})^{p}}<\infty .
\end{aligned}
$$

Now

$$
\begin{aligned}
& \left|f_{i}\left(\varkappa, \wp, x(\varkappa, \wp), q_{i}(x(\varkappa, \wp))\right)-f_{i}\left(\varkappa, \wp, y(\varkappa, \wp), q_{i}(y(\varkappa, \wp))\right)\right|^{p} \\
& \leq 2^{p-1}\left|\sum_{j=i}^{i+1} \frac{\left|x_{j}(\varkappa, \wp)\right|-\left|y_{j}(\varkappa, \wp)\right|}{4^{2} j^{2}}\right|^{p}+2^{p-1}\left|\frac{q_{i}(x(\varkappa, \wp))-q_{j}(y(\varkappa, \wp))}{e^{\varkappa \wp}}\right|^{p} \\
& \leq 2^{p-1}\left|\sum_{j=i}^{i+1} \frac{\left|x_{j}(\varkappa, \wp)-y_{j}(\varkappa, \wp)\right|}{4^{2} j^{2}}\right|^{p}+2^{p-1}\left|\frac{q_{i}(x(\varkappa, \wp))-q_{j}(y(\varkappa, \wp))}{e^{\varkappa \wp}}\right|^{p} \\
& \leq 4^{p-1} \sum_{j=i}^{i+1} \frac{\left|x_{j}(\varkappa, \wp)-y_{j}(\varkappa, \wp)\right|^{p}}{4^{2 p} j^{2 p}}+\frac{2^{p-1}}{e^{p \varkappa \wp}}\left|q_{i}(x(\varkappa, \wp))-q_{j}(y(\varkappa, \wp))\right|^{p} \\
& \leq \frac{2}{4^{p+1}}\left|x_{i}(\varkappa, \wp)-y_{i}(\varkappa, \wp)\right|^{p}+\frac{2^{p-1}}{e^{p \varkappa \wp}}\left|q_{i}(x(\varkappa, \wp))-q_{j}(y(\varkappa, \wp))\right|^{p} .
\end{aligned}
$$

Here $\hat{b}_{i}(\varkappa, \wp)=\frac{2}{4^{p+1}}, \hat{\psi}_{i}(\varkappa, \wp)=\frac{2^{p-1}}{e^{p \mu \rho}}$ are both bounded functions for all $\varkappa, \wp \in I, i \in \mathbb{N}$ and $\sum_{i \geq 1}\left|f_{i}\left(\varkappa, \wp, x^{0}(\varkappa, \wp), 0\right)\right|$ converges to zero. Also we have $\hat{B}=\frac{2}{4^{p+1}}$ and $\bar{\psi}=2^{p-1}$.
Again

$$
\begin{aligned}
& \left|h_{i}(\varkappa, \wp, x(\varkappa, \wp))-h_{i}(\varkappa, \wp, y(\varkappa, \wp))\right|^{p} \\
& =\left|\frac{1}{8+\varkappa^{2} \wp^{2}} \sum_{j=i}^{i+1}\left(\frac{x_{j}(\varkappa, \wp)-y_{j}(\varkappa, \wp)}{j^{2}}\right)\right|^{p} \\
& \leq \frac{2^{p-1}}{8^{p}} \sum_{j=i}^{i+1} \frac{\left|x_{j}(\varkappa, \wp)-y_{j}(\varkappa, \wp)\right|^{p}}{j^{2 p}} \\
& \leq \frac{1}{4^{p}}\left|x_{i}(\varkappa, \wp)-y_{i}(\varkappa, \wp)\right|^{p} .
\end{aligned}
$$

Here $\hat{D}_{i}=\frac{1}{4^{p}}$ so we have $\hat{D}=\frac{1}{4^{p}}$. Therefore $0<\hat{B}+\hat{D}<4^{1-p}$.
Again we have $\gamma(\varkappa, \wp)=2^{p-1} \cdot\left(\frac{\sqrt{\varkappa \wp}}{e^{\chi \varkappa \rho}}\right)^{p}$ is bounded and $\hat{\gamma}=2^{p-1} \cdot\left(\frac{1}{\sqrt{2 e}}\right)^{p}$. Since

$$
\begin{aligned}
& \left|\int_{0}^{s} \int_{0}^{t} \frac{\sin ^{2}\left(1+\sum_{j=1}^{2 i} x_{j}(v, w)\right)}{\left(\varkappa \wp+i^{2}\right)(\varkappa-v)^{\frac{1}{2}}(\wp-w)^{\frac{1}{2}}} d v d w\right| \\
& \leq \frac{4 \sqrt{\varkappa \wp}}{\varkappa \wp+i^{2}} \leq \frac{4}{\sqrt{\varkappa \wp+i^{2}}} \leq \frac{4}{i} .
\end{aligned}
$$

Therefore $\hat{r}_{i} \leq 4^{p} \sum_{k \geq i} \frac{1}{k^{p}}=4^{p} B_{1}<\infty$ for all $i \in \mathbb{N}$, where $B_{1}=\sum_{k \geq 1} \frac{1}{k^{p}}<\infty$ as $p>1$.
Thus $\lim _{i \rightarrow \infty} \hat{r}_{i}=0$ and $\hat{R}=4^{p} B_{1}$.
It is obvious that $h_{i}, f_{i}$ and $u_{i}$ are continuous functions. So all the assumptions from (i)-(vii) are satisfied. Hence by Theorem 3.1, we conclude that the systems (3) has a solution in $C\left(I \times I, \ell_{p}\right)$.
